

Deliverable 5 - Evidence Summary

Multi-bridge aggregation between Stellar and EVM chains: **11 successful transfers + 1 documented refund** across three bridges.

Allbridge - 3 successful, incl. 2 inbound Ethereum -> Stellar (slides 5, 7)

Squid (Coral RFQ over Axelar GMP) - 4 successful, incl. inbound from Ethereum and BNB Chain (slides 10, 12), plus a documented refund case (slide 8)

Near Intents - 4 successful, incl. inbound from Ethereum and BNB Chain (slides 15, 16)

Every bridge is proven in the deliverable's target direction - into Stellar - with source and destination transactions linked on each evidence slide.

Comparison Module - Ranked Quotes

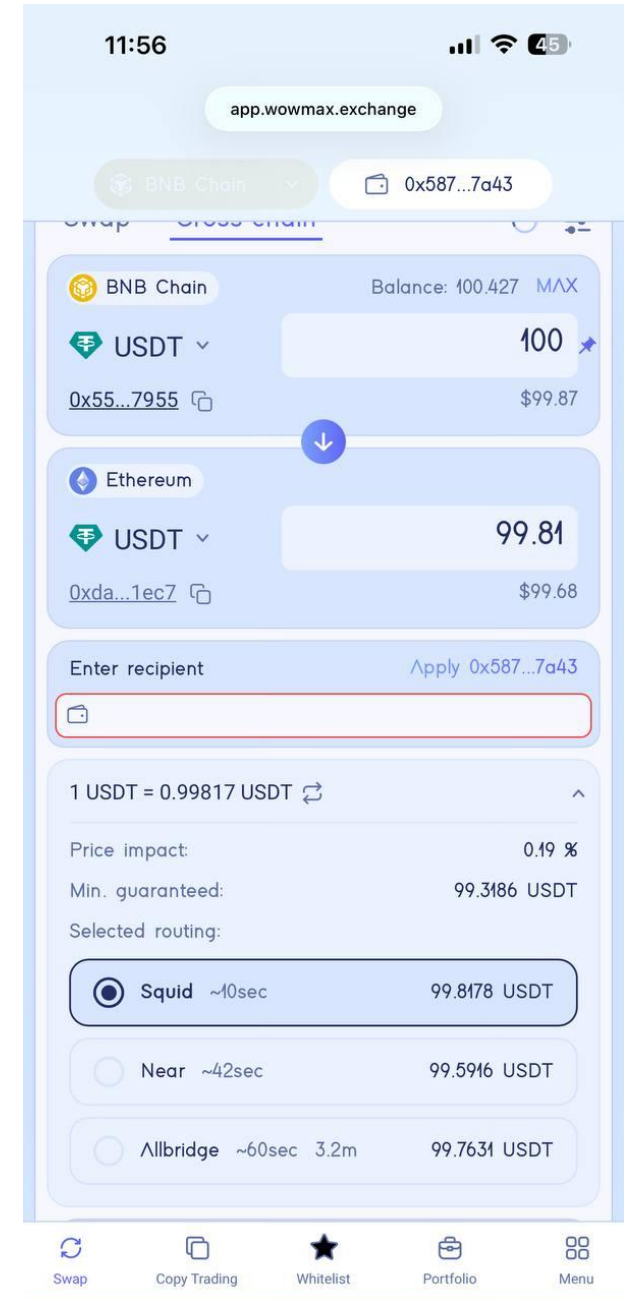

Each quote returns every viable route, ranked by net output. The route cards surface all three deliverable metrics side by side:

Cost - net destination amount per route (headline figure on each card)

Finality - live ETA per bridge, from ~10 sec RFQ fills to ~60 sec pool transfers

Liquidity - route-capacity badge (e.g. $\leq 3.2m$): live pool depth for Allbridge, capacity probing for RFQ bridges (Squid, Near)

The best route is selected automatically; the user can override with one tap. Routes that cannot absorb the requested amount drop out of the list at quote time.

Bridge Set: Squid in Place of a Direct Axelar Path

The deliverable text named Allbridge + Axelar (+ Near). Production ships with **Allbridge + Squid + Near**.

Squid is the Axelar path. Squid's Coral RFQ settles over Axelar GMP - Axelar's canonical routing layer for cross-chain token transfers. Every Squid transfer in this deck crossed Axelar rails.

A direct Axelar ITS adapter is implemented in the aggregator and participates in quoting and route comparison. Client execution is routed via Squid, which consistently returned better pricing and faster finality on the tested pairs.

Net effect: Axelar coverage is delivered through its production routing layer, while users get strictly better execution than a direct ITS transfer would provide.

Tracking, Retries & Refunds

Delivery tracking. Every transfer is tracked to destination delivery: the UI polls bridge-level status (SDK transfer status for Allbridge, RFQ order status for Squid, intent status for Near) and holds a “Bridging...” state until funds land on the destination chain. On delivery the recipient balance refreshes in place.

Refunds. Failed RFQ fills refund automatically to the sender - see the documented Squid case (slide 8): deposit and refund transactions linked, 53 minutes end-to-end, no user action required.

Retries. Transient failures recover without user involvement: quote requests fall back from the fast path to full aggregation, capacity probes retry on the next cycle, and wallet signing is guarded by a watchdog that releases the UI if a wallet never responds.
